

Some high school teachers spend most of their time lecturing while the students listen and take notes. Other high school teachers spend most of their time on discussion and projects that students are highly involved in, whereby they are given the opportunity to exchange their ideas. Which of the two above mentioned approaches do you think is the most effective? Why?

Traditionally High school students used to be able to walk down well-lit career paths, however today's learner faces a liquid or changing environment where an even broader range of skills are mandatory. To meet this need, no longer can teachers hold onto the teaching practices of old, but must embrace change to marry to the times.

Many of us have grown up in a society where our voices are not valued. In our school systems the same has been known to be true, whereby teachers speak at the students rather than interacting with them. This stifles not only independent thought, but the creativity that is required by our future society. Change must happen.

The ideas of pupils lend light to the teachings received in the classroom. This in essence pushes our peers in new and original directions.....
